Abstract

method present invention relates to а determining a friction coefficient value (Fµ) which represents the coefficient of friction present between the underlying surface and a vehicle tire. For this purpose, a wheel slip value (\lambda ij) is determined for at least one vehicle wheel, said value (\lambdaij) describing the wheel slip present at this vehicle wheel. friction coefficient value (Fu) is determined as function of this wheel slip value (λ ij). For this purpose, during a predefined operating state of the vehicle wheel slip values (λij) are determined various times, in particular successive times. frequency distribution of values is determined for these wheel slip values (\lambda ij) or for axle-related slip values (λ_{VA} and λ_{HA}) which are determined as a function slip values these wheel (λij) . The friction coefficient value (Fµ) is determined by evaluating this frequency distribution of values.
